

# RI.UVT.RO Redesign

## Role 3 Implementation Plan

*Information Architect + WordPress Structure Specialist*

*Headless WordPress + React Environment*

### 1. Role Overview

The Information Architect + WordPress Structure Specialist transforms institutional content into a scalable, maintainable, and API-ready backend structure. This role ensures the platform is logically organised, easy to navigate, future-proof for updates, and efficiently consumable by the React frontend.

### 2. Phase 1: Content Structure Analysis

#### Actual Work

- Analyse the existing website content, routes, and grouping.
- Identify:
  - Redundant or duplicated pages
  - Missing structural categories
  - Poor content grouping
  - Legacy routes requiring consolidation
- Define core content domains:
  - Erasmus+
  - Mobility programmes
  - Partnerships
  - International students
  - Student support
  - News / announcements

- Review how current structure affects user journeys.

#### Deliverable

- Structured content inventory and regrouping proposal.

### 3. Phase 2: Sitemap and Hierarchy Design

#### Actual Work

- Create full platform sitemap:
  - Top-level routes
  - Nested route groups
  - Priority landing pages
- Define hierarchy:
  - Parent-child relationships
  - Logical clusters of related content
  - Audience-first navigation groupings
- Align structure with UX flows and React routing needs.

#### Deliverable

- Final sitemap, route hierarchy, and page relationship model.

### 4. Phase 3: WordPress Backend Structure Configuration

#### Actual Work

- Implement the structure inside WordPress:
  - Create Pages and assign hierarchy
  - Configure menus
  - Define clean slugs
  - Prepare media/content organisation
- Ensure consistency between planned sitemap and CMS implementation.
- Coordinate permalink logic for frontend routing compatibility.

#### Deliverable

- Fully structured WordPress backend hierarchy aligned with frontend navigation.

## 5. Phase 4: Content Modeling and API Structures

### Actual Work

- Decide how content should be stored:
  - Static Pages
  - Posts
  - Custom Post Types
  - Shared taxonomies
- Define and coordinate:
  - Custom Post Types (programmes, opportunities, partnerships, documents)
  - Taxonomies (countries, categories, filters, tags)
  - Custom Fields (deadlines, contacts, PDFs, metadata)
- Ensure scalability:
  - New content can be added without restructuring the platform
- Ensure content models expose clean REST API data.

### Deliverable

- Scalable WordPress content architecture with API-ready dynamic structures.

## 6. Phase 5: Backend Usability and Maintainability

### Actual Work

- Optimise WordPress admin structure:
  - Clear labels for pages and content types
  - Logical dashboard grouping
  - Editorial simplicity
- Ensure:
  - Non-technical staff can update content
  - Future maintainers understand the system quickly
  - Content governance remains sustainable

### Deliverable

- Clean, intuitive, maintainable editorial backend.

## 7. Phase 6: Collaboration and Alignment

### Actual Work

- Work with Role 2:
  - Align structure with user journeys and navigation clarity
- Work with Role 1 and Role 5:
  - Ensure React routes and layouts reflect the defined architecture
- Work with Role 6:
  - Ensure content models and API exposure match frontend needs
- Work with Role 7:
  - Ensure labels, naming, and editorial grouping are understandable

### Deliverable

- Fully aligned structure across WordPress backend, API layer, and React frontend.

## 8. Final Output Responsibilities

- Complete sitemap and hierarchy definition
- Implemented WordPress backend structure and menus
- Defined content model (Pages, Posts, CPTs, taxonomies, fields)
- API-ready structured data architecture
- Alignment between structure, navigation, and frontend routes
- Scalable long-term maintainability model

*This role ensures the platform is not only visually improved, but structurally sound, scalable, and ready for long-term editorial growth.*
